

Figure 1. The relationship between the number of species and the number of individuals. The curve is a theoretical species accumulation curve.

Figure 1 shows the relationship between the number of species and the number of individuals. The curve is a theoretical species accumulation curve.

The curve shows that the number of species increases rapidly at first and then levels off as the number of individuals increases.

This is because the number of new species discovered decreases as the number of individuals increases.

The curve is a theoretical species accumulation curve, and it is used to estimate the number of species in a community.

The curve is used to estimate the number of species in a community by extrapolating the curve to the point where the number of individuals is equal to the total number of individuals in the community.

The curve is used to estimate the number of species in a community by extrapolating the curve to the point where the number of individuals is equal to the total number of individuals in the community.

The curve is used to estimate the number of species in a community by extrapolating the curve to the point where the number of individuals is equal to the total number of individuals in the community.

The curve is used to estimate the number of species in a community by extrapolating the curve to the point where the number of individuals is equal to the total number of individuals in the community.
